Digital Report Management

Automatic capture, storage and distribution of host-generated data for reports and statements

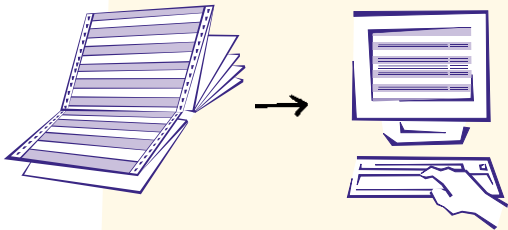

recallTM

TOTAL INFORMATION MANAGEMENT

Many enterprises incur astronomical costs for printing and distributing daily "green bar" reports, bills of lading and other data created by transaction-based business applications — data which is then often purged to optimize performance and storage capacity. ReView Digital Report Management automatically retrieves, indexes and stores this host-generated data on a relational database for widespread digital distribution. When the need for retrieval diminishes, ReView manages the data as it successively moves to more cost-effective storage media. The result? Ready access and greater efficiency with less expense.

Digital Report Management

Automatic capture, storage and distribution of host-generated data for reports and statements

Utilizing C.O.L.D. processing, ReView DRM automatically extracts and indexes information from data streams in transactional applications such as accounting and manufacturing systems. Information is stored on the ReView database and inexpensive media such as laser disks and CDs. Users can quickly access the statements and reports right from their desktops.

A hands-off solution for streamlining processes

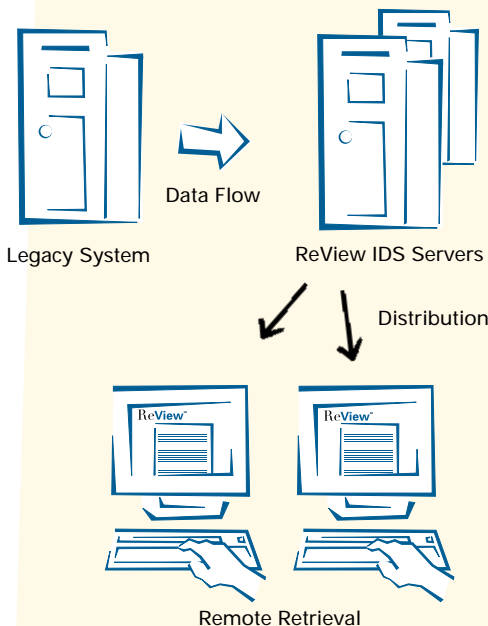

The ReView suite of Integrated Document Solutions greatly improves the ability to find and route business information. When the information originates as records in transactional applications, ReView Digital Report Management (DRM) steps in to automatically increase knowledge sharing and reduce data storage costs. Using C.O.L.D. processing, ReView automatically retrieves, identifies and compresses highly useful reports and statements that would otherwise be purged. ReView makes these documents highly accessible from a user's desktop. As they age, ReView transfers them to other cost-effective digital storage media, where they can still be easily reviewed by the user.

The fast way to retrieve and process documents

Quick, simple and easy to use, ReView can be configured to automatically locate and extract records from host-generated files such as invoices, letters, statements and even "green bar" reports. Users may then easily retrieve these records — and by double-clicking on an open document, instantly access related documents, regardless of data type. Plus, the records may be viewed, annotated, printed and faxed right from the desktop.

Accessibility made simple

Using CDs, optical disks and other media, ReView DRM provides cost-effective alternatives to storing data on expensive mainframes and servers — or paper and microfiche that restrict accessibility. ReView DRM can also be enhanced with distribution options. The system can automatically notify users that reports are available for use, and even automatically route those reports to users to speed analysis and business process control. Data may be accessed via the web and our ReQuestSM document/data management system.
